

# A NEW ERA IN HEART FAILURE PATIENT MANAGEMENT

## Medtronic InSync Sentry™ Cardiac Resynchronization Therapy Defibrillator With Automatic Fluid Status Monitoring

Heart Failure is the number one cause of hospital admissions, with most of these admissions due to fluid overload. Often, this buildup goes undetected and untreated until the patient is critically ill and must be hospitalized. The Medtronic InSync Sentry™ cardiac resynchronization therapy defibrillator (CRT-D) with automatic fluid status monitoring signals a new era in heart failure management, representing the convergence of sophisticated diagnostics and proven therapy in a single implantable device. A new feature called OptiVol™ Fluid Status Monitoring measures patient fluid status. As fluid builds up in the lungs (right), OptiVol can be programmed to alert patients and physicians to changes in fluid accumulation, offering the potential for early warning and appropriate clinical response.
